iframe attacks seem to be taking a hold with many vulnerable websites. The problem obviously being vu

If you are running apache, you will want to use our iframe filtering countermeasures. To do so, you will need to download two files:

[00_AS_L_iframe_protection.conf](#)

and

[/etc/asl/remove-bad-iframes.txt](#)

This will automatically clean all your websites and remove any iframes that would include trojans, etc. targeted at your users. Install the 00_AS_L_iframe_protection.conf file in your /etc/httpd/conf.d directory, and the remove-bad-iframes.txt in /etc/asl.
